

IMS7 Player

How to install it on a Fire TV Stick

Before you start

- A Fire TV Stick, plugged in and connected to wi-fi.
- Your IPTV details: the server address, username and password - or the M3U link your provider sent you.
- About ten minutes.

Already have IMS7 Player on this Fire TV?

Uninstall it first - step 3. This is needed once, and once only: the app is now signed properly, and Android will not install it over an older copy. From then on it updates itself.

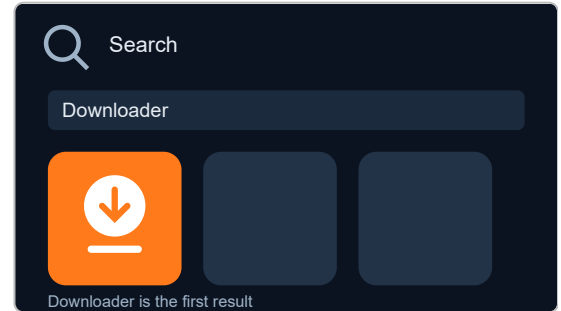

Version 1.11.4 · October 2026

1 Get the Downloader app

On the Fire TV home screen, go to the **magnifying glass** (Find) at the top left and choose **Search**.

Type **Downloader**, pick it from the list - the orange icon by AFTVnews - and choose **Get** or **Download**.

When it finishes, leave it for now. Do not open it yet.

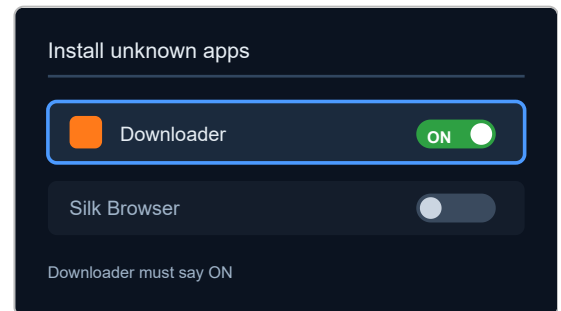

What the search looks like

2 Let Downloader install apps

Go to **Settings** (the gear at the top of the home screen), then:

1. **My Fire TV**
2. **Developer options**
3. **Install unknown apps**
4. Find **Downloader** in the list and press **OK** so it says **ON**

No **Developer options**? Go to **My Fire TV** → **About**, move down to **Fire TV Stick** and press **OK** seven times. It then appears.

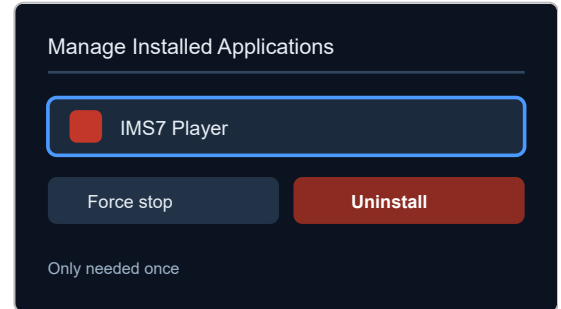

The switch must read ON

3 Remove the old copy (only if you have one)

Skip this if IMS7 Player has never been on this Fire TV.

1. **Settings** → **Applications**
2. **Manage Installed Applications**
3. **IMS7 Player**
4. **Uninstall**

You will have to type your IPTV username and password again afterwards. This is a one-off: future updates install themselves without any of this.

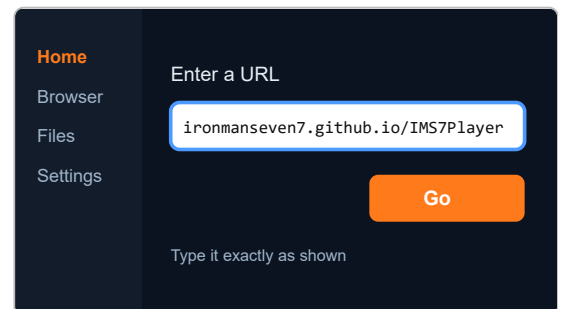

Choose Uninstall

4 Type the address into Downloader

Open **Downloader**. If it asks for permission to access files, choose **Allow**.

On the **Home** tab there is a box for a web address. Select it and type:

ironmanseven7.github.io/IMS7Player

The address box on the Home tab

No **www** and no **http** - just as printed. Then choose **Go**.

The download is about 4 MB and takes a few seconds.

5 Install it

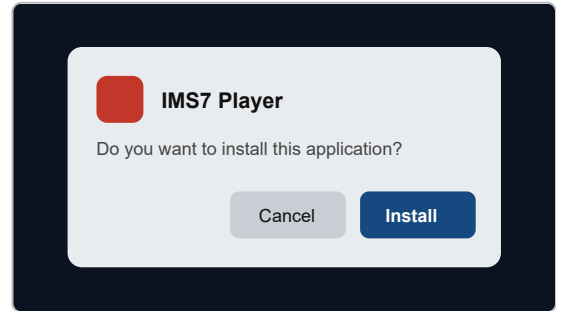

When the download finishes, a grey box appears asking whether to install **IMS7 Player**. Choose **Install** (bottom right).

Wait for **App installed**, then choose **Open**.

Downloader then offers to delete the file it downloaded. Choosing **Delete** is fine - the app itself is already installed.

"App not installed" instead?

An older copy is still on the stick. Go back to step 3, uninstall it, then try again.

Choose Install, then Open

6 Sign in

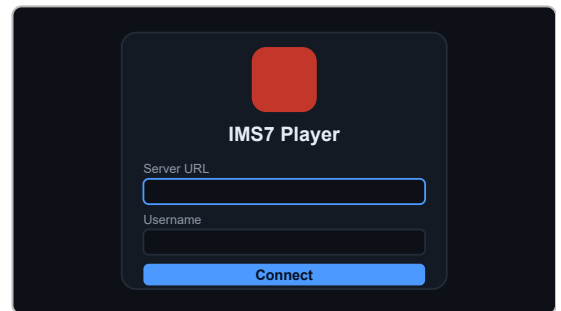

The app opens on a sign-in screen. The quickest way:

Paste your M3U link into the **Server URL** box - the long link your provider sent, the one with *username=* and *password=* in it. The app splits it up and fills in all three boxes for you.

Otherwise type them yourself:

- **Server URL** - e.g. `http://your-panel.com:8080`
- **Username** and **Password** - exactly as given, capitals matter

Leave **Remember on this machine** ticked, then choose **Connect**.

Paste the M3U link into the first box

Using it with the remote

Button	What it does
Arrows	Move between the columns: categories, channels, and the player on the right. Up from the top of a column reaches the menu bar.
OK	Chooses whatever is highlighted.
Back	Leaves full screen. Pressed again, it leaves the app.
Microphone	Not the Alexa button - use the Voice button in the app's menu bar, then say "watch ESPN", "bring up movies", "multiview".

Worth knowing

Full screen	The Full screen button next to the title, or OK on the picture.
Widescreen	Fills a 21:9 screen instead of leaving black bars at the sides. On a normal TV it is not needed.
Multiview	Up to four channels at once. Pick one tile with OK to give it the sound; OK again makes the grid full screen.
Next episode	Series play the next episode on their own, with a ten second countdown you can stop.
Favourites	The star button beside a channel's name; they gather under the Favourites tab.
Buffering	If a channel stutters, set Buffering in the menu bar to Smooth .

Updates happen on their own now

The app checks for a newer version and can install it without any of the steps in this guide. You will see an **Update**

banner, or you can switch on automatic updates when it offers. Only rarely - when the app itself changes rather than its screens - does it ask you to confirm an install.

If something goes wrong

What you see	What it means
"App not installed" when installing	An older copy of IMS7 Player is still on the stick. Uninstall it (step 3) and install again.
"Your internet connection is blocking this login"	Your home network, not the app. Some providers (AT&T's ActiveArmor, for one) block sign-ins to IPTV addresses. Allow the address in your router's security settings, ask your IPTV provider for a different address, or try the stick on a phone hotspot to confirm.
"Login rejected by the panel"	The username or password is wrong, or the line has expired. Capitals matter.
A film plays with no sound	That file's soundtrack is Dolby Digital or DTS, which no browser can decode - the app says so after a few seconds. Try another copy of the same title, or play it in VLC.
A channel never starts	Usually the line's connection limit: something else is already watching. The app shows how many connections your line allows.
Picture stutters	Set Buffering to Smooth in the menu bar. It waits a little longer before starting but holds up better.
Nothing above helps	Open Diagnostics in the menu bar. It lists exactly what the panel replied, with the password hidden, which is usually enough to tell what is wrong.

The address again, for reference

`ironmanseven7.github.io/IMS7Player`

If that ever fails to load, the long form works too:

`github.com/ironmanseven7/IMS7Player/releases/latest/download/app-debug.apk`

IMS7 Player 1.11.4 · the same app runs on Fire TV, Android TV boxes, phones and in a computer's browser.
